

# CREATING A WINDSTORM EVENT SET FROM PRIMAVERA DATA FOR THE (RE)INSURANCE INDUSTRY

**PRIMAVERA GA4, Barcelona, March 28<sup>th</sup> 2019**

**Julia Lockwood, Galina Guentchev, Erika Palin (Met Office),  
and WP10/11**

# INSURANCE/FINANCE INTERVIEWS

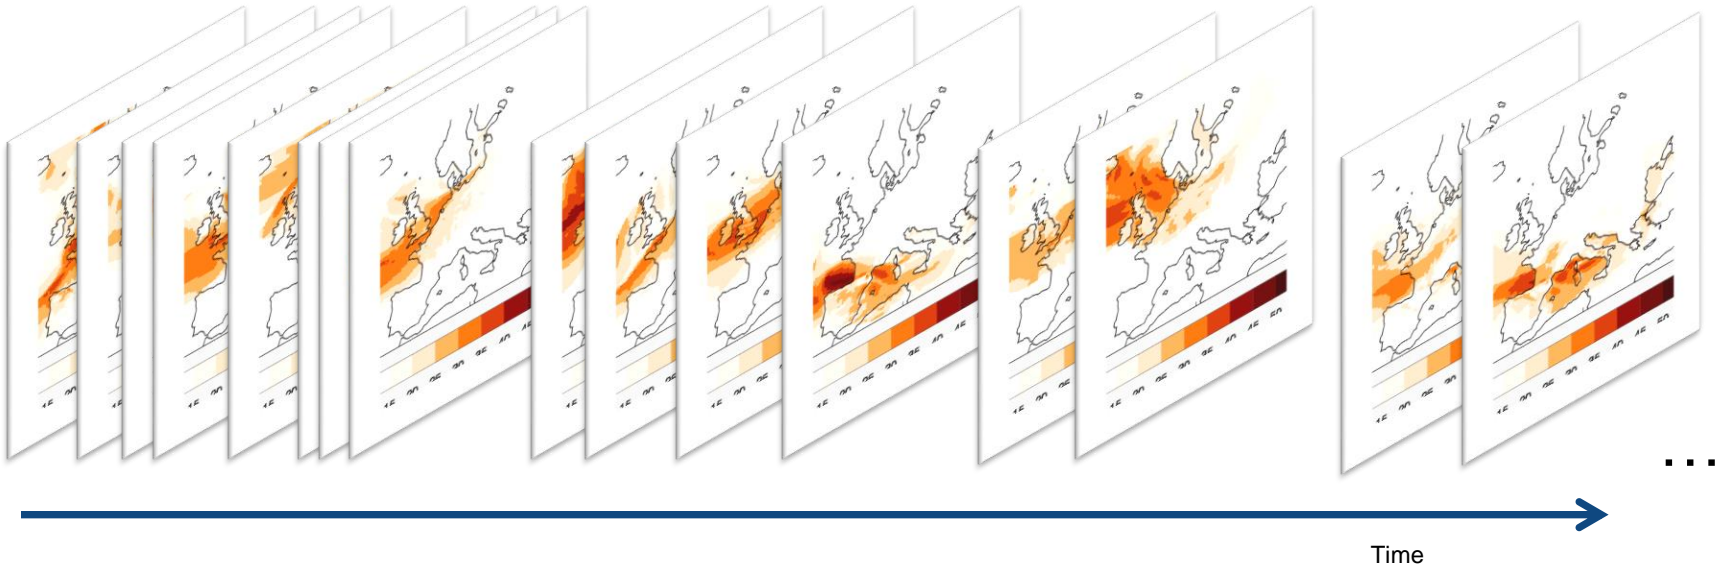

- June 2017 – 8 interviews with insurance/finance companies:
  - Primary insurers
  - Re-insurers
  - Risk management/consultancy companies
  - Regulators
- More info: [D11.6](#), [D10.1](#)
- Mostly interested in [windstorms](#) and [flooding](#) for Europe
- [Present day](#) risk, or near-term future (<5-10 yrs)
- [Solvency II regulation](#): Hold enough capital to withstand 1/200 year event.
- [Catastrophe modelling](#)

© Network Rail

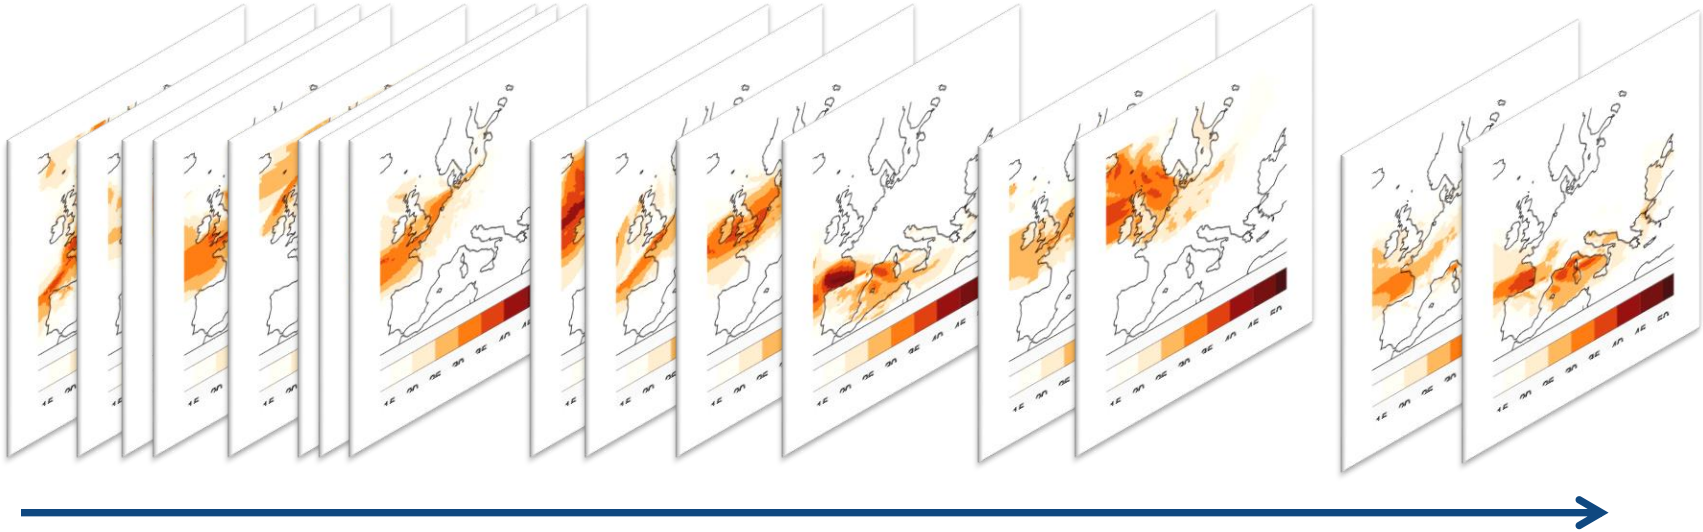

# CATASTROPHE MODELLING

- Hazard 'footprints' – event set

# CATASTROPHE MODELLING

- Hazard 'footprints' – event set

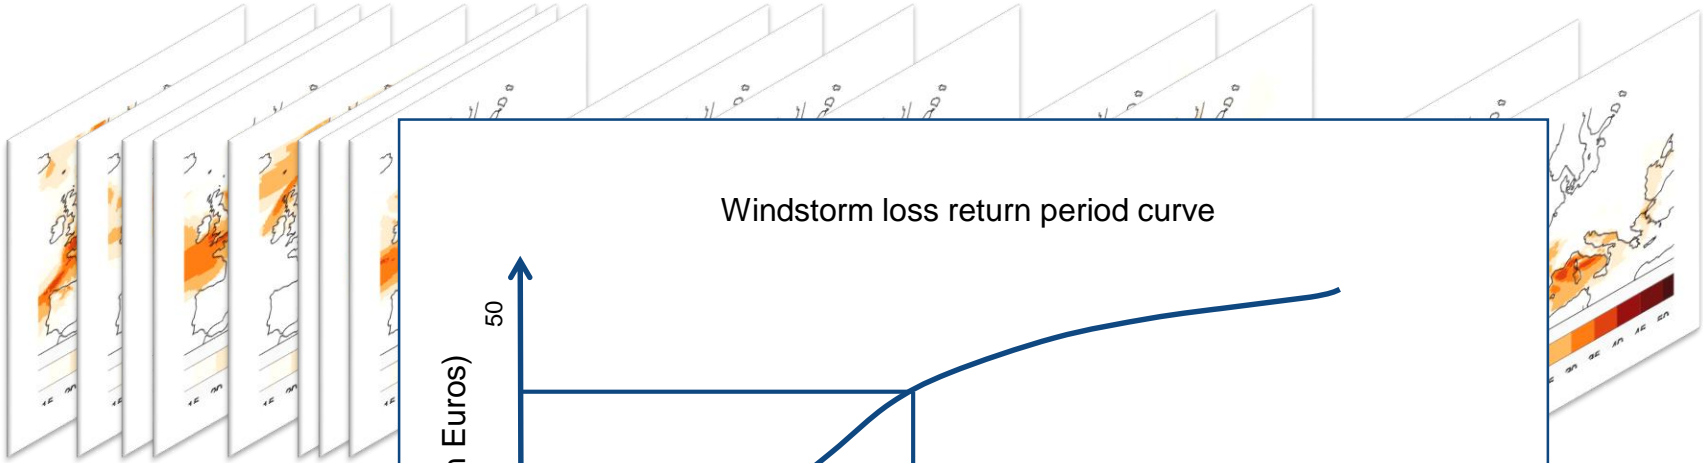

- Exposure and vulnerability – calculate loss

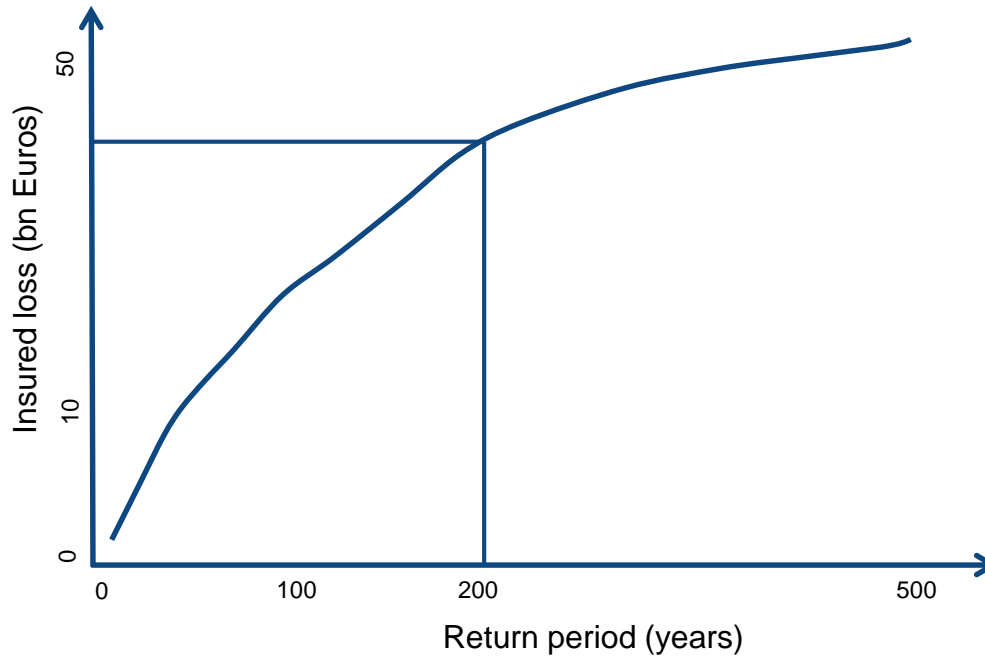

# CATASTROPHE MODELLING

- Hazard 'footprints' – event set

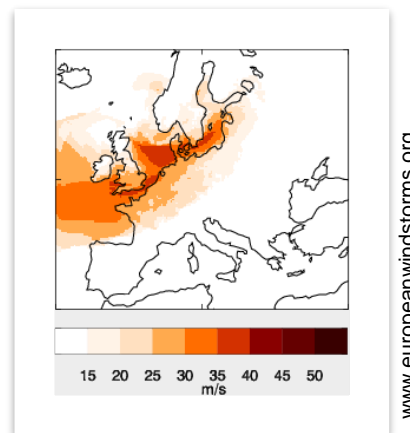

Windstorm loss return period curve

- Exposure and vulner

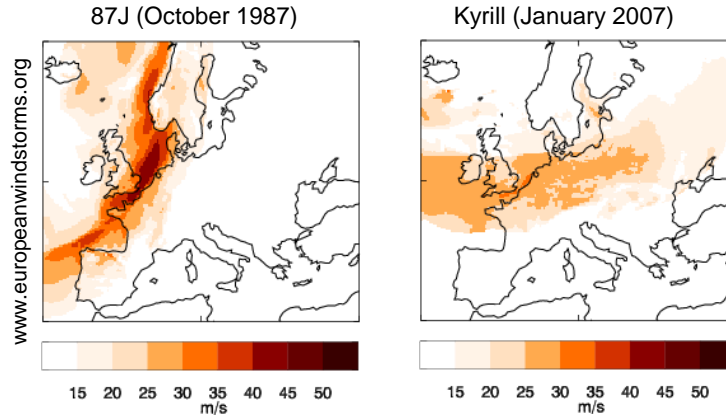

- Observational record too short – need statistical models or climate/dynamical models
- Use **PRIMAVERA** models to generate hazard footprints
- Atmosphere only, historical runs (1950-2014)
- Method (XWS – [www.europeanwindstorms.org](http://www.europeanwindstorms.org); WISC - <https://wisc.climate.copernicus.eu/wisc/>):
  - Track winter extra-tropical cyclones (Hodges 1995)
  - Find time of max 925hPa wind speed over European land
  - Max gusts/winds over 72 hours

# ANALYSIS

- Compare properties of footprints across resolutions and models (area, intensity)

- Simple catastrophe model (eg.  $\text{loss} \sim \sum_i \text{population density}_i * (\text{gust}_i > 25\text{m/s})^3$  – how do differences in storm track between models/resolutions translate to losses? (See slides by Galia Guentchev, [Tuesday] and following talk)
- Any benefits to 25km resolution compared to 60km?

# ANALYSIS

- Compare properties of footprint

- Simple catastrophe model (eg in storm track between model [Tuesday] and following talk)

Met Office, atm only  
Track density bias  
ERA

N96 (130km)

N216 (60km)

N512 (25km)

- Any benefits to 25km resolution compared to 60km?

# WEBINAR

- Presented plans to industry in webinar (19<sup>th</sup> March)
- Positive response!
- Also interest in footprints from **future climate runs, flooding, climate change v natural variability**
- Some issues:
  - Need at least **daily max winds** (no data from ECMWF?); Prefer maximum **gusts** (only two models – Met Office and EC-Earth)
  - Storms only tracked in 3 month seasons (SON, DJF, MAM, JJA), but want **October-March** storms.
  - How to share data?

# ANY QUESTIONS?
